TITLE: Concurrent Orthogonal Gears With Cylindrical Pinions Having Straight Involute Teeth

PERIODICAL: Metalurgia si Constructia de Masini, 1959, Vol 11, Nr 4, pp 291-297 (RUMANIA)

ABSTRACT: The author describes a gear which he affirms can successfully replace bevel gears. The gear described has a series of advantages as compared with bevel gears, like no need for special manufacturing machines, lack of delicate adjustment, easier assembly conditions due to the contact in a single point. The cylindrical pinion allows an axial movement of decoupling or even a reversed motion. The processing is said to be less expensive. The disadvantages are: limitation of the tooth width by the conditions of cutting, therefore limitation of the resistance to rupture and wear. The utilization is recommended where no great power transmission is required, like in jigs, machines and light transmission parts. The formation of the gear is explained by

Card 1/2

9-11-4-7/43

Concurrent Orthogonal Gears With Cylindrical Pinions Having Straight Involute Teeth

general kinematic considerations. It is imagined that a bevelled pinion having involute teeth is meshed with a wax disc. The rotation axes of the pinion and of the disc are concurrent and orthogonal. The pinion impresses a conjugated system of teeth into the disk-wheel, at a constant ratio of speed. The teeth generated have no involute section at any point. The authors give a detailed study of the machining of the disk-wheel and a mathematical description of the kinematics of the gear. There are 7 diagrams, 2 graphs and 3 references, 1 of which is Soviet, 1 American and 1 German.

 of Mildew in the Period of Flowering and During Rain.  
 ORIG. PUB. : anuarul lucrar. stiint. Inst. agron. Iasi, Bucuresti,  
 1957, 141-143  
 ABSTRACT : Spraying during the period of flowering with 0.75% Bordeaux mixture did not impair the fructification and did not lower the yield. When spraying during rain and after it, the adhesion of the mixture was obvious. Consequently, the flowering of the grape plant and the rainfall should not delay the treatment. The work was carried by Scientific Research Institute of Agronomy in Bucharest.

TITLE : Determination of the Number of Theoretical Steps of Countercurrent Separation

ORIG. PUB. : Magyar tud. akad. Mat. kutato int. kozl., 1957 (1958), 2, No 3-4, 227-245

ABSTRACT : As a general study model of rectification apparatus, absorbers, and extractors, there is considered a countercurrent extractor comprising  $n$  steps, with the feed-inflow to the  $k$  step. The system of equations for determination of the number of theoretical steps  $n$  is derived on the basis of the balance of materials for each step, with the following assumptions: the phase equilibrium curve can be replaced by a broken line; operating line of the process is a straight line; the inflowing mixture becomes distributed between the 2 currents in a definite ratio. The system of equations is solved for specific instances that are of practical importance. It is noted

"The Role of Acid Secretion in the Pathogenesis of Experimental Phenylbutazone Ulcers."

Budapest, Kiserletes Orvostudomány, Vol 14, No 5, Oct 62,  
pp 494-496.

Abstract: [Authors' Hungarian summary] The role of acid secretion in the development of ulcers caused by phenylbutazone was investigated. Administration of histamine does not aggravate, and administration of atropine and vagotomy does not prevent ulceration. Thus, the decisive role of increased acid production in experimental phenylbutazone-induced ulcer formation is denied. [11 references, mostly Western, rest Hungarian.]

"The Role of the Pituitary-Adrenal System in the Pathogenesis of Experimental Phenylbutazone Ulcers."

Budapest, Kiserletes Orvostudomány, Vol XV, No 4, Aug 1963, pages 446-448.

Abstract: [Authors' Hungarian summary] As a result of their own investigations the authors reached the conclusion that phenylbutazone exerts its ulcerogenic effect probably not by activation of the pituitary-adrenocortical system. Simultaneous administration of ACTH and cortisone with phenylbutazone increases the severity of the ulcers formed. This is considered the result of the summation of the effect of two ulcerogenic compounds. Attention is called to the dangers of simultaneous administration of phenylbutazone and steroid. 3 Hungarian, 8 Western references.

"Evaluation of K-Strophanthin in Crude and in Drug Form by Chemical Methods."

Prague, Ceskoslovenska Farmacie, Vol 15, No 7, Sep 66, pp 341-348

Abstract [Authors' English summary modified]: Content of total glycosides is determined colorimetrically by Baljet's reaction to strophanthidin used as a standard. The content of the individual main glycosides of K-strophanthin is determined colorimetrically after separation by paper chromatography. The part of glycosides derived from 17-beta-H-strophanthidin, from strophanthidin acid, and from 10-beta-hydroxy-19-nor-periplogenin is determined after hydrolysis; the products of hydrolysis are separated by paper chromatography, and the determination of the intensity of their fluorescence is used for a semiquantitative evaluation of their amounts. 4 Figures, 4 Tables, 22 Western, 1 Czech, 1 Russian, 2 East German references. Title : Experimental Work on Replacing Dura Mater by Amnion

Orig Pub : Ceskosl. neurol., 1957, 20, No 4, 233-246

Abstract : The usefulness of amnion for replacement of dura mater in dogs, cats and guinea pigs was determined experimentally. It was established that the amnion, as compared with other substitutes (fibrine film, fibrine foam and fascia) corresponds to a greater degree to the demands placed on those substances. It is more available and withstands sterilization well and it conditions a comparatively small reaction of the surrounding cellular tissue. In the course of 2 months after surgery, its resorption takes place

and its replacement by a connective-tissue layer which subsequently cannot be microscopically differentiated from normal dura mater. In a majority of cases, amnion prevented proliferation of tissue into the brain, and by this also the formation of platyrrhine adhesion of the connective tissue with the surface of injured brain. The regeneration of arachnoid was absent and, after its injury, adhesions between the membranes were always observed. -- K.G. Gazaryan

TITLE:

An accessory for reversible positioning of the recording medium of memory devices 16C

PERIODICAL:

Referativnyy zhurnal, Avtomatika, telemekhanika i vychislitel'naya tekhnika, no. 4, 1963, 41, abstract 48227 (Czechosl. pat. k. 42 n, 32; 43a, 41/02, no. 103333, 15.04.62)

TEXT:

The text describes a mechanical accessory for shifting a recording medium in the form of a rectangular plate and made from pliable and resilient material, from storage cassette to recording and counting devices, and the reverse. The recording medium may be a plastic card (such as a perforated card) covered with a ferromagnetic layer. The principle of the mechanism is based on the fact that the card passes between three revolving rollers with resilient suspension. The axes of the rollers are parallel and are disposed in a single plane. In the forward direction the card passes between the extreme and middle rollers; in the reverse position, between the other extreme and middle rollers. If the middle roller revolves continuously in one direction, setting both extreme rollers in motion, then the card is moved in the reverse direction. Three variants of the mechanism based

Title : A Study of the Modification of Several Strains  
of Dysentery Bacteria Under the Influence of  
Chloramphenicol

Orig Pub: Med. doswiad. i mikrobiol., 1956, 8, No. 3, 311-  
315

Abstract: Strains of *Shigella schmitzi* and *Sh. sonnei* were  
obtained which were resistant to the action of  
chloramphenicol (0.25 and 1.7 mg/ml respectively).  
Morphologically they differed from the original,  
but not biochemically. The quantity of proteins  
and nucleic acids of the sensitive and resistant  
strains was identical. The authors consider that  
the mechanism of the action of chloramphenicol
